Fischer et Crosse, Miss. Mex. 1: 192, and X. salleanus (Pfr.), Pils., Proc. Malac. Soc. London 4: 28.
My one specimen, from a tree-trunk in the creek valley below Sumidero (D, II, e, 6), near Córdoba, was so firmly muscular and wiggled so furiously that I was startled into dropping it. The embryonic whorls of its shell are as in $X$. cordovanus but the later whorls approach those of $\boldsymbol{X}$. salleanus and are much more glossy than those of Bunnya. Although its male organs are quite large, its female genitalia are still immature, and possibly the spermathecal diverticulum becomes less conspicuous when fully adult. [S. \& P. found none.]

Living animal like Bunnya, but: Foot pallid, mottled with brown; tail with brown middorsal stripe; ommatophores dark; edge of shell-lap brown.

Preserved animal also similar but: Shell-lap about twice as broad and coarsely pebbled thronghout. [In S. \& P., figs. 7, A-B, appearance of shell-lobes and short tail "horn" evidently due to contraction.] Lung considerably smaller, with brownish bands; kidney with much more shortened hindgut margin so that shape appears more oblong [Cf. S. \& P., f. 7-C] Spermatheca very slender but with distinct cylindric diverticulum [like in X. sumichrasti]. Dart-glands 2, with few tubules [probably more in adult], with ducts entering vaginal wall above still rudimentary dart-sac. [Cf. S. \& P.. f. 7-F; $\mathrm{gm}_{1}=$ dart-glands; gm = dart-sac, placed like vaginal diverticulum of Bummya.] Epiphallus proper very much shorter than flagellum [like Pils.. f. $14]$; penial retractor inserting around junction with penis, which is relatively larger; vergic papilla flattened ovoid [like S. \& P.. f. 7-G], with epiphallic opening near its base but continned to apex by deep croove [somewhat as in Averellia]. Jaw with 11-13, higher ribs, of which both edges are sharply marked I see S. \& P.J about 14 teeth hicnspid and 20 with some trace of entocone [S. \& P. give 22 bicuspid and 10 tricuspid] ; outer teeth more commonly dividing entocones and ectocones; 131 rows comnted. Buceal retractor even slenderer, but with similar origin [Cf. Pils.].

## A NEW GENUS OF CHINESE MICROCYSTINAE

Through the generosity of Mr. Teng-ehien Yen, the anatomy (Plate 6) of a specimen of Hyalina rathouisii Heude (1882, Moll.
